# THE NUMBER OF IRREDUCIBLE POLYNOMIALS WITH FIRST TWO PRESCRIBED COEFFICIENTS OVER A FINITE FIELD

## MATILDE LALÍN, OLIVIER LAROCQUE

ABSTRACT. We use elementary combinatorial methods together with the theory of quadratic forms over finite fields to obtain the formula, originally due to Kuz'min, for the number of monic irreducible polynomials of degree n over a finite field  $\mathbb{F}_q$  with first two prescribed coefficients. The formula relates the number of such irreducible polynomials to the number of polynomials that split over the base field.

### 1. Introduction

Let  $\mathbb{F}_q$  be the finite field of q elements and characteristic p and let  $\mathbf{a} = (a_1, \dots, a_\ell)$  be fixed. The problem of counting the number of irreducible polynomials

$$x^{n} + a_{1}x^{n-1} + \dots + a_{\ell}x^{n-\ell} + t_{\ell+1}x^{n-\ell-1} + \dots + t_{n} \in \mathbb{F}_{q}[x]$$

has been studied extensibly. Aymptotic results were initiated by Artin [Ar24] and were answered in the most generality by Cohen [Co72]. In the domain of exact formulas, Carlitz [Car52] and Yucas [Yu06] have stablished formulas where the first or the last coefficient are fixed. This has also been studied by Omidi Koma, Panario, and Wang [OPW10]. Kuz'min [Ku89, Ku90] has proven formulas when the first two coefficients are fixed and obtained partial results with three coefficients [Ku94]. There are also works of Kuz'min [Ku91], Cattell, Miers, Ruskey, Sawada and Serra [CMRSS03], Yucas and Mullen [YM04] and Fitzerald and Yucas [FY03] that go up to three fixed coefficients in characteristic 2. More extensive results in characteristic 2 and 3 were proven by Moisio and Ranto [MR08]. We refer the reader to surveys of Cohen [Co05, Co13] for more information.

In this work, we examine the problem of two fixed coefficients. Let  $H_n(a_1, a_2)$  be the number of irreducible polynomials of the form

$$x^{n} + a_{1}x^{n-1} + a_{2}x^{n-2} + t_{3}x^{n-3} + \dots + t_{n} \in \mathbb{F}_{q}[x].$$

Kuz'min, building upon ideas of Carlitz [Car52] and Hayes [Ha65], proves the following result.

**Theorem 1.1.** [Ku90, Ku91] Let p > 2 and a be nonzero, then for  $n \ge 2$ 

(1.1) 
$$H_n(0,a) = \frac{1}{n} \sum_{\substack{d \mid n \\ p \nmid d}} \mu(d) \delta_{n/d}(-a/d),$$

and

$$H_n(0,0) = \frac{1}{n} \sum_{\substack{d \mid n \\ p \nmid d}} \mu(d) \delta_{n/d}(0) - \frac{\varepsilon}{n} \sum_{\substack{d \mid \frac{n}{n} \\ n \nmid d}} \mu(d) q^{n/dp},$$

where  $\varepsilon = 1$  if  $p \mid n$  and 0 otherwise.

Key words and phrases. irreducible polynomials, finite fields.

This work was supported by he Natural Sciences and Engineering Research Council of Canada [Discovery Grant 355412-2013] and the Fonds de recherche du Québec - Nature et technologies [Établissement de nouveaux chercheurs 144987 and Projet de recherche en équipe 166534].

If  $p \mid n$ 

$$H_n(1,0) = \frac{1}{q^2 n} \sum_{\substack{d \mid n \\ p \nmid d}} \mu(d) q^{n/d}.$$

Here,  $\mu$  denotes the Möebius function defined as

 $\mu(n) = \begin{cases} (-1)^r & n \text{ square-free and } n \text{ is a product of } r \text{ distinct primes,} \\ 0 & n \text{ is not square-free.} \end{cases}$ 

For  $n \geq 1$  and  $a \in \mathbb{F}_q$ ,

$$\delta_n(a) = q^{n-2} + (-1)^n (q^{n-2} - Q_{n-1}(a)),$$

with  $Q_n(a)$  being the number of solutions of the equation

(1.2) 
$$\sum_{i=1}^{n} x_i^2 + \sum_{1 \le i < j \le n} x_i x_j = a.$$

For p > 2,  $p \nmid n$ ,

$$\delta_n(a) = \begin{cases} q^{n-2} - \binom{(-1)^l la}{q} q^{l-1} & n = 2l, \\ q^{n-2} + v(a) \binom{(-1)^l n}{q} q^{l-1} & n = 2l + 1, \end{cases}$$

while for  $p \mid n$ ,

$$\delta_n(a) = \begin{cases} q^{n-2} - v(a) {\binom{(-1)^l}{q}} q^{l-1} & n = 2l, \\ q^{n-2} + {\binom{(-1)^{l-1}2a}{q}} q^l & n = 2l+1, \end{cases}$$

where

$$v(a) = \begin{cases} -1 & a \neq 0, \\ q - 1 & a = 0. \end{cases}$$

When  $p \nmid n$ , the change of variables  $x_1 = x + \frac{\grave{a_1}}{n}$  allows us to write

$$H_n(a_1, a_2) = H_n\left(0, a_2 - \frac{n-1}{2n}a_1^2\right).$$

When  $p \mid n$  and  $a_1 \neq 0$ , the change  $x_1 = \frac{1}{a_1} \left( x - \frac{a_2}{a_1} \right)$  implies

$$H_n(a_1, a_2) = H_n(1, 0).$$

Therefore, Theorem 1.1 provides a complete answer for the value of  $H_n(a_1, a_2)$  in all cases. A similar result for p = 2 is also proven in [Ku90, Ku91].

Let  $X_{(d^{n/d})}(0,a)$  denote the number of polynomials of the form  $f^{n/d}$  with f irreducible, and such that  $a_1 = 0$  and  $a_2 = a$ . The key to the proof of Theorem 1.1 lies in the equation

(1.3) 
$$\sum_{d|n} dX_{(d^{n/d})}(0,a) = \delta_n(-a).$$

The final result is then proven by means of Möbius inversion.

The first cases of Theorem 1.1 for  $n \leq 7$  are analyzed in [Ku89] by elementary combinatorial methods, while the general case is proven in [Ku90, Ku91] by using L-functions and Gauss sums.

The goal of this paper is to complete the work of [Ku89], namely to show that the elementary combinatorial methods introduced by Kuz'min can be also used to prove Equation (1.3) and ultimately Theorem 1.1 completely. This is analogous to the work of Yucas [Yu06] who gave elementary proofs for results of Carlitz [Car52] for fixed first or constant coefficient.

The combinatorial method has great potential for finding formulas in other cases, most notably in the cases of different prescribed factorization type. This method is also promising for formulas involving a higher number of fixed coefficients, althought it should be noted that proving such formulas would be quite involved from the combinatorial point of view. Finally, we remark that the combinatorial part of the method works

for any characteristic as reflected in the statement of Equation (1.3). We focus in the case of p > 2 for simplicity, but the central proof is independent of the characteristic.

### 2. Notation

Let  $\mathbf{a} = (a_1, \dots, a_\ell)$  with  $\ell \leq n$ . Let  $\mathcal{P}_n(\mathbf{a})$  be the set of polynomials of the form  $x^n + a_1 x^{n-1} + \dots + a_\ell x^{n-\ell} + t_{\ell+1} x^{n-\ell-1} + \dots + t_n \in \mathbb{F}_q[x]$ . Let  $H_n(\mathbf{a})$  be the number of polynomials in  $\mathcal{P}_n(\mathbf{a})$  that are irreducible. We write  $\mathcal{P}_n$  and  $H_n$  when no conditions are imposed on the coefficients.

By the type of a polynomial in  $\mathbb{F}_q[x]$  we refer to the collection of degrees of irreducible factors together with their multiplicities in the canonical decomposition of the polynomial over  $\mathbb{F}_q[x]$ . For example,  $x^2(x+1)$  has type  $(1^2,1)$ . Thus, we denote by  $X_{\mathbf{v}}(\mathbf{a})$  the number of polynomials of type  $\mathbf{v}$  in  $\mathcal{P}_n(\mathbf{a})$ . For example,  $X_{(1^2,1)}$  (with no condition on the coefficients) denotes the number of polynomials of type  $(1^2,1)$ , i.e., polynomials of the form  $(x+\alpha)^2(x+\beta)$  with  $\alpha \neq \beta$ . Then we have that  $X_{(1^2,1)} = q(q-1)$ .

In this paper we are going to work mainly with the specific case of  $\ell = 2$ . Accordingly,  $n \geq 2$ .

## 3. Result and strategy

Our goal is to prove Equation (1.1). We are going to obtain this result as a corollary to the following identity.

$$(3.1) \qquad \sum_{d \mid n \atop n \nmid t \stackrel{n}{=}} dH_d\left(0, \frac{ad}{n}\right) + (-1)^n \sum_{e_1 + \dots + e_k = n} \frac{n!}{e_1! \cdots e_k!} X_{(1^{e_1}, \dots, 1^{e_k})}(0, a) = q^{n-2} + (-1)^n q^{n-2}.$$

This equation reduces to Equation (1.1) by application of Möbius inversion because of the following result:

(3.2) 
$$\sum_{e_1+\dots+e_k=n} \frac{n!}{e_1!\dots e_k!} X_{(1^{e_1},\dots,1^{e_k})}(0,a) = Q_{n-1}(-a).$$

One can easily see that the left hand side of (3.2) is equivalent to the number of solutions of

$$\begin{cases} \sum_{i=1}^{n} x_i = 0, \\ \sum_{1 \le i < j \le n} x_i x_j = a, \end{cases}$$

which can be seen to be the same as the number of solutions of (1.2) (with the opposite sign for a). Then the number  $Q_{n-1}(-a)$  is found by using Minkowski's method from the theory of quadratic forms over finite fields, see [Mi84, Cas11] for more details.

Equation (3.1) is analogous to

(3.3) 
$$\sum_{d|n} dH_d + (-1)^n \sum_{e_1 + \dots + e_k = n} \frac{n!}{e_1! \dots e_k!} X_{(1^{e_1}, \dots, 1^{e_k})} = q^n + (-1)^n q^n,$$

and

(3.4) 
$$\sum_{\substack{d|n\\p\nmid \frac{n}{q}}} dH_d\left(\frac{ad}{n}\right) + (-1)^n \sum_{e_1 + \dots + e_k = n} \frac{n!}{e_1! \cdots e_k!} X_{(1^{e_1}, \dots, 1^{e_k})}(a) = q^{n-1} + (-1)^n q^{n-1}.$$

Notice that in the case of Equation (3.3) we have that

(3.5) 
$$\sum_{e_1+\dots+e_k=n} \frac{n!}{e_1!\dots e_k!} X_{(1^{e_1},\dots,1^{e_k})} = q^n,$$

since this is equivalent to all the possible products of linear factors that one can form by choosing n ordered linear factors among q possibilities. By Equation (3.4) we have, for  $p \nmid n$  and  $a \neq 0$ ,

(3.6) 
$$\sum_{e_1+\dots+e_k=n} \frac{n!}{e_1!\dots e_k!} X_{(1^{e_1},\dots,1^{e_k})}(a) = q^{n-1},$$

since this is the number of solutions of

$$\sum_{i=1}^{n} x_i = -a.$$

By Möbius inversion, Equations (3.3) and (3.4) imply the well-known results

(3.7) 
$$H_n = \frac{1}{n} \sum_{d|n} \mu(d) q^{n/d},$$

(3.8) 
$$H_{n}(a) = \begin{cases} \frac{1}{qn} \sum_{\substack{d \mid n \\ p \nmid d}} \mu(d)q^{n/d} & a \neq 0, \\ \frac{1}{qn} \sum_{\substack{d \mid n \\ p \nmid d}} \mu(d)q^{n/d} - \frac{\varepsilon}{n} \sum_{\substack{d \mid \frac{n}{p} \\ p \nmid d}} \mu(d)q^{n/dp} & a = 0, \end{cases}$$

where  $\varepsilon = 1$  if  $p \mid n$  and 0 otherwise. See, for example, [Yu06]

*Proof (Theorem 1.1).* Equations (3.1) and (3.2) combined yield

$$\sum_{\substack{d \mid n \\ p \nmid \frac{n}{n}}} dH_d\left(0, \frac{ad}{n}\right) = \delta_n(-a).$$

Write  $n = mp^r$  with  $p \nmid m$ . Thus, we write, more precisely,

$$\sum_{d|m} dp^r H_{dp^r} (0, a_1 d) = \delta_{mp^r} (-a_1 m).$$

where  $a_1 = \frac{a}{m}$ . By Möbius inversion,

$$mp^r H_{mp^r}(0, a_1 m) = \sum_{d|m} \delta_{dp^r}(-a_1 d),$$

which translates into (1.1) by reversing all the changes of variable.

Now (3.8) and (1.1) give us

$$H_{n}(0,0) = H_{n}(0) - \sum_{a \neq 0} H_{n}(0,a)$$

$$= \frac{1}{qn} \sum_{\substack{d \mid n \\ p \nmid d}} \mu(d) q^{n/d} - \frac{\varepsilon}{n} \sum_{\substack{d \mid \frac{n}{p} \\ p \nmid d}} \mu(d) q^{n/dp} - \frac{1}{n} \sum_{\substack{d \mid n \\ p \nmid d}} \mu(d) \sum_{a \neq 0} \delta_{n/d}(-a/d).$$

By observing that  $\sum_a Q_{n/d-1}(-a/d)$  is simply the number of possibilities of choosing n/d-1 elements in  $\mathbb{F}_q$ ,  $q^{n/d-1}$ , we conclude

$$\sum_{a\neq 0} \delta_{n/d}(-a/d) = \sum_{a} \delta_{n/d}(-a/d) - \delta_{n/d}(0) = q^{n/d-1} - \delta_{n/d}(0).$$

Thus,

$$H_n(0,0) = \frac{1}{n} \sum_{\substack{d \mid n \\ p \nmid d}} \mu(d) \delta_{n/d}(0) - \frac{\varepsilon}{n} \sum_{\substack{d \mid \frac{n}{p} \\ p \nmid d}} \mu(d) q^{n/dp}.$$

If  $p \mid n$ , we have

$$H_n = \sum_{a_1, a_2} H_n(a_1, a_2) = \sum_{a_1 \neq 0, a_2} H_n(a_1, a_2) + \sum_{a_2} H_n(0, a_2)$$

$$= (q - 1)qH_n(1, 0) + H_n(0)$$

$$= (q - 1)qH_n(1, 0) + H_n - (q - 1)H_n(1).$$

Thus,

$$H_n(1,0) = \frac{1}{q}H_n(1)$$
  
=  $\frac{1}{q^2n}\sum_{\substack{d|n\\p \nmid d}} \mu(d)q^{n/d}$ .

This completes the proof of Theorem 1.1 from Equation (3.1).

The rest of the paper is devoted to give a combinatorial proof of Equation (3.1).

## 4. A family of equations

The following lemma is the starting point for generating relationships among the  $X_{\mathbf{v}}(\mathbf{a})$ 's.

**Lemma 4.1.** Let  $0 \le k \le n - \ell$ . A monic polynomial of degree k divides  $q^{n-\ell-k}$  polynomials in  $\mathcal{P}_n(\mathbf{a})$ .

Proof. For a generic polynomial  $f(x) = x^n + a_1 x^{n-1} + \dots + a_\ell x^{n-\ell} + t_{\ell+1} x^{n-\ell-1} + \dots + t_n \in \mathcal{P}_n(\mathbf{a})$  and a fixed polynomial  $g(x) = x^k + b_1 x^{k-1} + \dots + b_{k-1} x + b_k$  such that  $g(x) \mid f(x)$ , we write f(x) = g(x)h(x) with  $h(x) = x^{n-k} + c_1 x^{n-k-1} + \dots + c_{n-k-1} x + c_{n-k}$ . Given the values  $b_1, \dots, b_k$ , the numbers  $c_1, \dots, c_{n-k}$  must satisfy the equations

$$\begin{cases} b_1 + c_1 = a_1 \\ b_2 + b_1 c_1 + c_2 = a_2 \\ \dots \\ b_{\ell} + b_{\ell-1} c_1 + \dots + b_1 c_{\ell-1} + c_{\ell} = a_{\ell} \end{cases}$$

where we set  $b_i = 0$  if i > k.

Thus, g(x) fixes the first  $\ell$  coefficients of h(x). There are  $n-k-\ell$  choices for the remaining coefficients of h(x).

Given a factorization type  $\mathbf{v}$ , the *degree*, denoted  $\deg(\mathbf{v})$ , is simply the degree of the resulting polynomial. We note that there is a more precise way of describing a certain factorization type  $\mathbf{v}$  of degree n by means of an  $n \times n$  matrix  $V = (v_{i,j})$ , where the entry  $v_{i,j}$  indicates the number of factors of the form  $i^j$  in the factorization type. Then the matrix V must satisfy

$$\deg(V) := \sum_{i,j} ij v_{i,j} = n.$$

Accordingly, we use the notation  $X_V(\mathbf{a})$  as equivalent to the notation  $X_{\mathbf{v}}(\mathbf{a})$ .

The *length* of  $\mathbf{v}$ , denoted  $\lg(\mathbf{v})$  or  $\lg(V)$  is defined as,

$$\lg(V) := \sum_{i,j} j v_{i,j}.$$

Our goal is to find a formula for  $X_{(n)}(0, a)$ . In order to do that, we are going to consider the equations that we can form with the  $X_{\mathbf{v}}(\mathbf{a})$ .

Let V, W be  $n \times n$  matrices with integral entries. We say that W is majored by V (written  $W \leq V$ ) if and only if

$$\begin{cases} w_{i,n} \le v_{i,n} \\ w_{i,n} + w_{i,n-1} \le v_{i,n} + v_{i,n-1} \\ \dots \\ w_{i,n} + \dots + w_{i,1} \le v_{i,n} + \dots + v_{i,1} \end{cases}$$

for each  $i = 1, \ldots n$ .

Any factorization type  $\mathbf{w}$  of total degree k less or equal than  $n-\ell$  may be represented by a matrix W with  $\sum_{i,j} ijw_{i,j} = k$ . For any such factorization type  $\mathbf{w}$  we may consider all the factorization types  $\mathbf{v}$  of degree n such that  $\mathbf{w}$  is a factor. This is simply the set of  $\mathbf{v}$  such that  $W \leq V$ . Counting the number of polynomials of each of these types and using Lemma 4.1 yield the following equation:

$$\sum_{V \succeq W} \prod_{i=1}^{n} {v_{i,n} \choose w_{i,n}} {v_{i,n} + v_{i,n-1} - w_{i,n} \choose w_{i,n-1}} \cdots {v_{i,n} + \cdots + v_{i,1} - w_{i,n} - \cdots w_{i,2} \choose w_{i,1}} X_{V}(\mathbf{a})$$

$$= q^{n-\ell-k} \prod_{i=1}^{n} {H_{i} \choose w_{i,1} \dots w_{i,n}}$$

where  $H_i$  denotes the number of irreducible polynomials of degree i, with no restrictions.

We refer to Equation (4.1) as  $\mathcal{E}_{\mathbf{w}}(\mathbf{a})$  or  $\mathcal{E}_{W}(\mathbf{a})$ .

#### 5. A COMBINATION OF EQUATIONS

We are going to consider a certain combination of equations of the form  $\mathcal{E}_{\mathbf{w}}(\mathbf{a})$ . From now on we are going to assume that  $\ell=2$ . However, the combination we find also works for smaller values  $\ell=0,1$ .

Consider the following set

$$W_a = \{ \mathbf{w} \text{ factorization type } | \deg(\mathbf{w}) \le n - 2, w_{i,j} = 0, j > 1 \}.$$

Then we write

$$A: \sum_{\mathbf{w} \in \mathcal{W}_a} (-1)^{\lg(\mathbf{w})} (n - \deg(\mathbf{w})) \mathcal{E}_{\mathbf{w}}(\mathbf{a}).$$

Observe that this is a combination of equations.

Now define

$$\mathcal{W}_b = \{ \mathbf{w} \text{ factorization type } | \deg(\mathbf{w}) \le n - 2, w_{i,j} = 0, j > 1, w_{11} \ne 0 \},$$

and

$$B:-\sum_{\mathbf{w}\in\mathcal{W}_b}(-1)^{\lg(\mathbf{w})}\mathcal{E}_{\mathbf{w}}(\mathbf{a}).$$

Finally, consider the set

$$\mathcal{W}_c = \{ \mathbf{w} \text{ factorization type } | \deg(\mathbf{w}) \le n - 2, w_{i,j} = 0, i, j > 1, \exists j_0, w_{1,j_0} \ne 0 \}.$$

We will work with the sequence given by

$$\alpha_s = \sum_{j=0}^s j! \binom{s}{j}.$$

Let  $\gamma$  be a function on n-vectors with nonnegative integral entries given by the following recurrence.

• For  $s_1 \geq 0$ ,

$$\gamma(s_1,0,0,\ldots,0)=\alpha_{s_1}.$$

• When there is an i > 1 with  $s_i \neq 0$ , we have

$$\gamma(s_1, s_2, \dots, s_{n-1}, s_n) = \sum_{j=1}^n \gamma(s_1, \dots, s_{j-1} + 1, s_j - 1, \dots, s_n) s_j.$$

Notice that the sum starts with  $\gamma(s_1 - 1, s_2, \dots, s_{n-1}, s_n)$  if  $s_1 \neq 0$ .

Now set

$$C: \sum_{\mathbf{w} \in \mathcal{W}_c} (-1)^{\lg(\mathbf{w})} \gamma(w_{1,1}, w_{1,2}, \dots, w_{1,n}) \mathcal{E}_{\mathbf{w}}(\mathbf{a}).$$

We will see in Section 7 that A + B + C give us the desired result, namely, Equation (3.1). Before that, we need to prove certain properties of  $\gamma$ .

6. A property of 
$$\gamma$$

In this section, we are going to prove the following.

**Proposition 6.1.** Let  $s_1, \ldots, s_n$  be nonnegative integers. Define

$$f(s_1, \dots, s_n) := \sum_{t_i \ge 0} \gamma(t_1, t_2, \dots, t_n) \times (-1)^{t_1 + \dots + nt_n} \binom{s_n}{t_n} \binom{s_n + s_{n-1} - t_n}{t_{n-1}} \dots \binom{s_n + \dots + s_1 - t_n - \dots - t_2}{t_1}.$$

Then, we have

(6.1) 
$$f(s_1, \dots, s_n) = (-1)^{s_1 + 2s_2 + \dots + ns_n} \frac{(s_1 + 2s_2 + \dots + ns_n)!}{(1!)^{s_1} (2!)^{s_2} \cdots (n!)^{s_n}}.$$

Before proceeding to the proof of this result, we need to consider the following lemma.

**Lemma 6.2.** For  $(s_1, \ldots, s_n) \neq (0, \ldots, 0)$ , We have the following recurrence relation.

(6.2) 
$$f(s_1, \dots, s_n) = -\sum_{j=1}^n s_j f(s_1, \dots, s_{j-1} + 1, s_j - 1, \dots, s_n).$$

*Proof.* First notice that for s > 0,

$$f(s, 0, ..., 0) = \sum_{0 \le t \le s} \gamma(t, 0, ..., 0) (-1)^t \binom{s}{t}$$

$$= \sum_{0 \le t \le s} \alpha_t (-1)^t \binom{s}{t}$$

$$= \alpha_0 + \sum_{1 \le t \le s} (\alpha_{t-1}t + 1) (-1)^t \binom{s}{t}$$

$$= \sum_{0 \le t \le s} (-1)^t \binom{s}{t} + s \sum_{1 \le t \le s} \alpha_{t-1} (-1)^t \binom{s-1}{t-1}$$

$$= -sf(s-1, 0, ..., 0).$$

By applying the recurrence of  $\gamma$ ,

$$f(s_1, \dots, s_n) = \sum_{t_i \ge 0} \sum_{j=1}^n \gamma(t_1, \dots, t_{j-1} + 1, t_j - 1, \dots, t_n) t_j$$

$$\times (-1)^{t_1 + \dots + nt_n} \binom{s_n}{t_n} \binom{s_n + s_{n-1} - t_n}{t_{n-1}} \cdots \binom{s_n + \dots + s_1 - t_n - \dots - t_2}{t_1}.$$

Remark that it is correct to apply the recurrence relation for the part of the sum involving the terms  $\gamma(t_1, 0, \ldots, 0)$  due to the case  $f(s, 0, \ldots, 0)$  analyzed above.

We now look at the term for a fixed value of j. First notice that

$$\gamma(t_{1}, \dots, t_{j-1} + 1, t_{j} - 1, \dots, t_{n}) t_{j} \binom{s_{n} + \dots + s_{j} - t_{n} - \dots - t_{j+1}}{t_{j}}$$

$$\times \prod_{i=j+1}^{n} \binom{s_{n} + \dots + s_{i} - t_{n} - \dots - t_{i+1}}{t_{i}}$$

$$= \gamma(t_{1}, \dots, t_{j-1} + 1, t_{j} - 1, \dots, t_{n}) (s_{n} + \dots + s_{j} - t_{n} - \dots - t_{j+1})$$

$$\times \binom{s_{n} + \dots + s_{j} - t_{n} - \dots - t_{j+1} - 1}{t_{j} - 1}$$

$$\times \prod_{i=j+1}^{n} \binom{s_{n} + \dots + s_{i} - t_{n} - \dots - t_{i+1}}{t_{i}} ,$$

where we have manipulated the j-binomial coefficient. Now we isolate the factor  $s_j$  in order to obtain

$$= \gamma(t_{1}, \dots, t_{j-1} + 1, t_{j} - 1, \dots, t_{n}) s_{j} \binom{s_{n} + \dots + s_{j} - t_{n} - \dots - t_{j+1} - 1}{t_{j} - 1}$$

$$\times \prod_{i=j+1}^{n} \binom{s_{n} + \dots + s_{i} - t_{n} - \dots - t_{i+1}}{t_{i}}$$

$$+ \gamma(t_{1}, \dots, t_{j-1} + 1, t_{j} - 1, \dots, t_{n}) (s_{n} + \dots + s_{j+1} - t_{n} - \dots - t_{j+1})$$

$$\times \binom{s_{n} + \dots + s_{j} - t_{n} - \dots - t_{j+1} - 1}{t_{j} - 1}$$

$$\times \prod_{i=j+1}^{n} \binom{s_{n} + \dots + s_{i} - t_{n} - \dots - t_{i+1}}{t_{i}}$$

By manipulating the j + 1-binomial coefficient, we find

$$= \gamma(t_{1}, \dots, t_{j-1} + 1, t_{j} - 1, \dots, t_{n}) s_{j} \binom{s_{n} + \dots + s_{j} - t_{n} - \dots - t_{j+1} - 1}{t_{j} - 1}$$

$$\times \prod_{i=j+1}^{n} \binom{s_{n} + \dots + s_{i} - t_{n} - \dots - t_{i+1}}{t_{i}}$$

$$+ \gamma(t_{1}, \dots, t_{j-1} + 1, t_{j} - 1, \dots, t_{n}) (s_{n} + \dots + s_{j+1} - t_{n} - \dots - t_{j+2})$$

$$\times \binom{s_{n} + \dots + s_{j} - t_{n} - \dots - t_{j+1} - 1}{t_{j} - 1}$$

$$\times \binom{s_{n} + \dots + s_{j+1} - t_{n} - \dots - t_{j+2} - 1}{t_{j+1}} \prod_{i=j+2}^{n} \binom{s_{n} + \dots + s_{i} - t_{n} - \dots - t_{i+1}}{t_{i}} .$$

Again, we isolate the factor  $s_{j+1}$ ,

$$= \gamma(t_{1}, \dots, t_{j-1} + 1, t_{j} - 1, \dots, t_{n}) s_{j} \binom{s_{n} + \dots + s_{j} - t_{n} - \dots - t_{j+1} - 1}{t_{j} - 1}$$

$$\times \prod_{i=j+1}^{n} \binom{s_{n} + \dots + s_{i} - t_{n} - \dots - t_{i+1}}{t_{i}}$$

$$+ \gamma(t_{1}, \dots, t_{j-1} + 1, t_{j} - 1, \dots, t_{n}) s_{j+1} \binom{s_{n} + \dots + s_{j} - t_{n} - \dots - t_{j+1} - 1}{t_{j} - 1}$$

$$\times \binom{s_{n} + \dots + s_{j+1} - t_{n} - \dots - t_{j+2} - 1}{t_{j+1}} \prod_{i=j+2}^{n} \binom{s_{n} + \dots + s_{i} - t_{n} - \dots - t_{i+1}}{t_{i}}$$

$$+ \gamma(t_{1}, \dots, t_{j-1} + 1, t_{j} - 1, \dots, t_{n}) (s_{n} + \dots + s_{j+2} - t_{n} - \dots - t_{j+2})$$

$$\times \binom{s_{n} + \dots + s_{j} - t_{n} - \dots - t_{j+1} - 1}{t_{j} - 1}$$

$$\times \binom{s_{n} + \dots + s_{j+1} - t_{n} - \dots - t_{j+2} - 1}{t_{j+1}} \prod_{i=j+2}^{n} \binom{s_{n} + \dots + s_{i} - t_{n} - \dots - t_{i+1}}{t_{i}}$$

We rewrite the last row as two products:

$$= \gamma(t_{1}, \dots, t_{j-1} + 1, t_{j} - 1, \dots, t_{n}) s_{j} \binom{s_{n} + \dots + s_{j} - t_{n} - \dots - t_{j+1} - 1}{t_{j} - 1}$$

$$\times \prod_{i=j+1}^{n} \binom{s_{n} + \dots + s_{i} - t_{n} - \dots - t_{i+1}}{t_{i}}$$

$$+ \gamma(t_{1}, \dots, t_{j-1} + 1, t_{j} - 1, \dots, t_{n}) s_{j+1} \binom{s_{n} + \dots + s_{j} - t_{n} - \dots - t_{j+1} - 1}{t_{j} - 1}$$

$$\times \binom{s_{n} + \dots + s_{j+1} - t_{n} - \dots - t_{j+2} - 1}{t_{j+1}} \prod_{i=j+2}^{n} \binom{s_{n} + \dots + s_{i} - t_{n} - \dots - t_{i+1}}{t_{i}}$$

$$+ \gamma(t_{1}, \dots, t_{j-1} + 1, t_{j} - 1, \dots, t_{n}) (s_{n} + \dots + s_{j+2} - t_{n} - \dots - t_{j+3})$$

$$\times \binom{s_{n} + \dots + s_{j} - t_{n} - \dots - t_{j+1} - 1}{t_{j} - 1}$$

$$\times \prod_{i=j+1}^{j+2} \binom{s_{n} + \dots + s_{i} - t_{n} - \dots - t_{i+1} - 1}{t_{i}} \prod_{i=j+3}^{n} \binom{s_{n} + \dots + s_{i} - t_{n} - \dots - t_{i+1}}{t_{i}}$$

This process is repeated until we reach the following

$$= \gamma(t_{1}, \dots, t_{j-1} + 1, t_{j} - 1, \dots, t_{n}) \begin{pmatrix} s_{n} + \dots + s_{j} - t_{n} - \dots - t_{j+1} - 1 \\ t_{j} - 1 \end{pmatrix}$$

$$\times \sum_{\ell=j}^{n} s_{\ell} \prod_{i=j+1}^{\ell} \begin{pmatrix} s_{n} + \dots + s_{i} - t_{n} - \dots - t_{i+1} - 1 \\ t_{i} \end{pmatrix}$$

$$\times \prod_{i=\ell+1}^{n} \binom{s_{n} + \dots + s_{i} - t_{n} - \dots - t_{i+1}}{t_{i}}$$

We now introduce the remaining factors

$$\gamma(t_1, \dots, t_{j-1} + 1, t_j - 1, \dots, t_n) t_j \prod_{i=1}^n \binom{s_n + \dots + s_i - t_n - \dots - t_{i+1}}{t_i}$$

$$= \gamma(t_1, \dots, t_{j-1} + 1, t_j - 1, \dots, t_n) \prod_{i=1}^{j-2} \binom{s_n + \dots + s_i - t_n - \dots - t_{i+1}}{t_i}$$

$$\times \binom{s_n + \dots + s_{j-1} - t_n - \dots - t_j}{t_{j-1}} \binom{s_n + \dots + s_j - t_n - \dots - t_{j+1} - 1}{t_j - 1}$$

$$\times \sum_{\ell=j}^n s_\ell \prod_{i=j+1}^\ell \binom{s_n + \dots + s_i - t_n - \dots - t_{i+1} - 1}{t_i} \prod_{i=\ell+1}^n \binom{s_n + \dots + s_i - t_n - \dots - t_{i+1}}{t_i}$$

We manipulate the j-1-binomial coefficient

$$= \gamma(t_1, \dots, t_{j-1} + 1, t_j - 1, \dots, t_n) \prod_{i=1}^{j-2} \binom{s_n + \dots + s_i - t_n - \dots - t_{i+1}}{t_i}$$

$$\times \binom{s_n + \dots + s_{j-1} - t_n - \dots - t_j + 1}{t_{j-1} + 1} \binom{s_n + \dots + s_j - t_n - \dots - t_{j+1} - 1}{t_j - 1}$$

$$\times \sum_{\ell=j}^n s_\ell \prod_{i=j+1}^{\ell} \binom{s_n + \dots + s_i - t_n - \dots - t_{i+1} - 1}{t_i} \prod_{i=\ell+1}^n \binom{s_n + \dots + s_i - t_n - \dots - t_{i+1}}{t_i}$$

$$- \gamma(t_1, \dots, t_{j-1} + 1, t_j - 1, \dots, t_n) \prod_{i=1}^{j-2} \binom{s_n + \dots + s_i - t_n - \dots - t_{i+1}}{t_i}$$

$$\times \binom{s_n + \dots + s_{j-1} - t_n - \dots - t_j}{t_{j-1} + 1} \binom{s_n + \dots + s_j - t_n - \dots - t_{j+1} - 1}{t_j - 1}$$

$$\times \sum_{\ell=j}^n s_\ell \prod_{i=j+1}^{\ell} \binom{s_n + \dots + s_i - t_n - \dots - t_{i+1} - 1}{t_i} \prod_{i=\ell+1}^n \binom{s_n + \dots + s_i - t_n - \dots - t_{i+1}}{t_i}$$

Taking into account the signs, the terms containing  $\gamma(t_1,\ldots,t_{j-1}+1,t_j-1,\ldots,t_n)$  with j>2 yield

$$-\sum_{\ell=j}^{n} s_{\ell} f(s_1, \dots, s_{j-1}+1, \dots, s_{\ell}-1, \dots, s_n) + \sum_{\ell=j}^{n} s_{\ell} f(s_1, \dots, s_{j-2}+1, \dots, s_{\ell}-1, \dots, s_n).$$

On the other hand, the term containing  $\gamma(t_1 - 1, \dots, t_n)$  yields

$$-\sum_{\ell=1}^{n} s_{\ell} f(s_1, \dots, s_{\ell} - 1, \dots, s_n),$$

while the one containing  $\gamma(t_1+1,t_2-1,\ldots,t_n)$  yields

$$-\sum_{\ell=2}^{n} s_{\ell} f(s_1+1,\ldots,s_{\ell}-1,\ldots,s_n) + \sum_{\ell=2}^{n} s_{\ell} f(s_1,\ldots,s_{\ell}-1,\ldots,s_n).$$

Putting all of this together, we get,

$$f(s_1, \dots, s_n) = -\sum_{j=1}^n \sum_{\ell=j}^n s_{\ell} f(s_1, \dots, s_{j-1} + 1, \dots, s_{\ell} - 1, \dots, s_n)$$

$$+ \sum_{j=2}^n \sum_{\ell=j}^n s_{\ell} f(s_1, \dots, s_{j-2} + 1, \dots, s_{\ell} - 1, \dots, s_n)$$

$$= -\sum_{j=1}^n \sum_{\ell=j}^n s_{\ell} f(s_1, \dots, s_{j-1} + 1, \dots, s_{\ell} - 1, \dots, s_n)$$

$$+ \sum_{h=1}^{n-1} \sum_{\ell=h+1}^n s_{\ell} f(s_1, \dots, s_{h-1} + 1, \dots, s_{\ell} - 1, \dots, s_n)$$

$$= -\sum_{j=1}^n s_j f(s_1, \dots, s_{j-1} + 1, s_j - 1, \dots, s_n).$$

This concludes the proof of the recurrence for  $f(s_1, \ldots, s_n)$ .

Proof of Proposition 6.1. Observe that for  $s=0, f(0,\ldots,0)=1$ . Now assume that s>0. We have

$$f(s,0,\ldots,0) = \sum_{t\geq 0} \alpha_t (-1)^t \binom{s}{t}$$
$$= \sum_{t=0}^s \sum_{j=0}^t j! \binom{t}{j} (-1)^t \binom{s}{t}.$$

By exchanging the order of summation,

$$f(s,0,\ldots,0) = \sum_{j=0}^{s} j! {s \choose j} \sum_{t=j}^{s} (-1)^{t} {s-j \choose t-j}.$$

Now notice that the inner sum equals zero unless s = j and in that case it equals  $(-1)^s$ . Thus we get

$$f(s,0,\ldots,0) = (-1)^s s! = (-1)^s \frac{s!}{(1!)^s}.$$

We proceed by induction on  $k = s_1 + 2s_2 + \cdots + ns_n$ . Remark that we have proven the case of  $k = s_1$  for any value of k. We are going to apply the recurrence (6.2). Observe that in the term  $f(s_1, \ldots, s_{j-1} + 1, s_j - 1, \ldots, s_n)$  we have  $s_1 + \cdots + (j-1)(s_{j-1} + 1) + j(s_j - 1) + \cdots + ns_n = k-1$ . Thus, by induction hypothesis,

$$f(s_1, \dots, s_n) = -\sum_{j=1}^n s_j f(s_1, \dots, s_{j-1} + 1, s_j - 1, \dots, s_n)$$

$$= -\sum_{j=1}^n s_j (-1)^{s_1 + 2s_2 + \dots + ns_n - 1} \frac{(s_1 + 2s_2 + \dots + ns_n - 1)!}{(1!)^{s_1} \cdots ((j-1)!)^{s_{j-1} + 1} (j!)^{s_j - 1} \cdots (n!)^{s_n}}$$

$$= (-1)^{s_1 + 2s_2 + \dots + ns_n} \frac{(s_1 + 2s_2 + \dots + ns_n - 1)!}{(1!)^{s_1} \cdots (n!)^{s_n}} \sum_{j=1}^n s_j \frac{j!}{(j-1)!}$$

$$= (-1)^{s_1 + 2s_2 + \dots + ns_n} \frac{(s_1 + 2s_2 + \dots + ns_n)!}{(1!)^{s_1} \cdots (n!)^{s_n}}.$$

This concludes the proof of Proposition 6.1.

7. 
$$A + B + C$$

In order to prove Equation (3.1) we need to compute the coefficient of each  $X_{\mathbf{v}}(\mathbf{a})$  in A+B+C. The following two equations are going to be key in this section

(7.1) 
$$\sum_{k=0}^{s} (-1)^k \binom{s}{k} = 0, \quad s \neq 0,$$

(7.2) 
$$\sum_{k=0}^{s} (-1)^k k \binom{s}{k} = 0, \quad s \neq 1.$$

7.1. The term A. The coefficient of  $X_{\mathbf{v}}(\mathbf{a})$  in A is given by

$$\sum_{0 \le w_{1,1} + \dots + nw_{n,1} \le n-2} (n - (w_{1,1} + \dots + nw_{n,1})) \prod_{i=1}^{n} (-1)^{w_{i,1}} \binom{v_{i,n} + \dots + v_{i,1}}{w_{i,1}}.$$

Because of Equations (7.1) and (7.2),

$$\sum_{0 \le w_{1,1} + \dots + nw_{n,1} \le n} (n - (w_{1,1} + \dots + nw_{n,1})) \prod_{i=1}^{n} (-1)^{w_{i,1}} \binom{v_{i,n} + \dots + v_{i,1}}{w_{i,1}} = 0,$$

unless one of the following applies:

•  $v_{i,n} + \cdots + v_{i,1} = 0$  for all i, or

• there is an  $i_0$  with  $v_{i_0,n} + \cdots + v_{i_0,1} = 1$  and  $v_{i,n} + \cdots + v_{i,1} = 0$  for all  $i \neq i_0$ .

The first case is impossible, since n > 0. For the second case, since  $\deg(\mathbf{v}) = n$ , the only possibility for this is  $v_{i_0,n/i_0} = 1$  and the rest is zero. We obtain the coefficient  $i_0$  for  $X_{\binom{n}{i_0}}(\mathbf{a})$ .

For the remaining  $X_{\mathbf{v}}(\mathbf{a})$ , the coefficient contributed by A must be

$$-\sum_{w_{1,1}+\cdots+nw_{n,1}=n-1}\prod_{i=1}^{n}(-1)^{w_{i,1}}\binom{v_{i,n}+\cdots+v_{i,1}}{w_{i,1}}.$$

Since we have  $w_{i,1} \leq v_{i,n} + \cdots + v_{i,1}$ , we obtain

$$n-1 = w_{1,1} + \dots + nw_{n,1} \le \sum_{i,j} iv_{i,j}$$

and

$$\sum_{i,j} ijv_{i,j} - 1 \le \sum_{i,j} iv_{i,j},$$

which implies

$$\sum_{i,j} i(j-1)v_{i,j} \le 1.$$

This can only happen if  $v_{i,j} = 0$  for all j > 1 with the exception of  $v_{1,2}$  which can be equal to 1 or 0. In any of these cases  $v_{i,1}$  can take any value. Thus, the contribution to the coefficient is given by

$$-\sum_{w_{1,1}+\cdots+nw_{n,1}=n-1} (-1)^{w_{1,1}} {v_{1,2}+v_{1,1} \choose w_{1,1}} \prod_{i=2}^n (-1)^{w_{i,1}} {v_{i,1} \choose w_{i,1}}.$$

First assume that  $v_{i,j} = 0$  for j > 1. Since  $w_{i,1} \le v_{i,1}$ , the case  $w_{1,1} + \cdots + nw_{n,1} = n-1$  occurs when  $w_{i,1} = v_{i,1}$  for i > 1 and  $w_{1,1} = v_{1,1} - 1$ . We obtain

$$(-1)^{v_{1,1}+\cdots+v_{n,1}}v_{1,1}.$$

Now assume  $v_{i,j}=0$  for all j>1 except that  $v_{1,2}=1$ . Once again we have  $w_{i,1}\leq v_{i,1}$  for i>1 and  $w_{1,1}\leq v_{1,1}+1$ . The case  $w_{1,1}+\cdots+nw_{n,1}=n-1$  occurs with  $w_{1,1}=v_{1,1}+1$ ,  $w_{i,1}=v_{i,1}$  for i>1 and the coefficient equals

$$(-1)^{v_{1,1}+\cdots+v_{n,1}}.$$

7.2. The term B. We look at expression B. The coefficient of  $X_{\mathbf{v}}(\mathbf{a})$  is given by

$$-\sum_{\substack{0 \le w_{1,1} + \dots + nw_{n,1} \le n-2 \\ w_{1,1} \ne 0}} \prod_{i=1}^{n} (-1)^{w_{i,1}} \binom{v_{i,n} + \dots + v_{i,1}}{w_{i,1}}.$$

Because of Equations (7.1) and (7.2),

$$-\sum_{0 \le w_{1,1} + \dots + nw_{n,1} \le n} \prod_{i=1}^{n} (-1)^{w_{i,1}} {v_{i,n} + \dots + v_{i,1} \choose w_{i,1}} = 0,$$

**unless**  $v_{i,n} + \cdots + v_{i,1} = 0$  for all i, which is impossible for n > 0.

The case  $w_{1,1} + 2w_{2,1} + \cdots + nw_{n,1} \ge n-1$  together with the conditions  $w_{i,1} \le v_{i,n} + \cdots + v_{i,1}$  for all i imply

$$\sum_{i,j} ijv_{i,j} - 1 = n - 1 \le w_{1,1} + 2w_{2,1} + \dots + nw_{n,1} \le \sum_{i,j} iv_{i,j},$$

which gives

$$\sum_{i,j} i(j-1)v_{i,j} \le 1.$$

This can only happen if  $v_{i,j} = 0$  for all j > 1 with the exception of  $v_{1,2}$  which can be equal to 1 or 0. In addition,  $v_{i,1}$  can take any value. Therefore, the contribution to the coefficient is

(7.3) 
$$\sum_{w_{1,1}+2w_{2,1}+\cdots+nw_{n,1}=n-1,n} (-1)^{w_{1,1}} \binom{v_{1,2}+v_{1,1}}{w_{1,1}} \prod_{i=2}^{n} (-1)^{w_{i,1}} \binom{v_{i,1}}{w_{i,1}}$$

(7.4) 
$$+ \sum_{2w_{2,1}+\cdots+nw_{n,1} < n-2} \prod_{i=2}^{n} (-1)^{w_{i,1}} {v_{i,1} \choose w_{i,1}}.$$

First assume that  $v_{i,j}=0$  for j>1. Since  $w_{i,1}\leq v_{i,1}$ , the case  $w_{1,1}+\cdots+nw_{n,1}=n-1$  occurs when  $w_{i,1}=v_{i,1}$  for i>1 and  $w_{1,1}=v_{1,1}-1$ . The case  $w_{1,1}+\cdots+nw_{n,1}=n$  can only occur if  $w_{i,1}=v_{i,1}$  for all i. We obtain that the contribution from (7.3) is

$$-(-1)^{v_{1,1}+\cdots+v_{n,1}}v_{1,1}+(-1)^{v_{1,1}+\cdots+v_{n,1}}.$$

Now assume  $v_{i,j}=0$  for all j>1 except that  $v_{1,2}=1$ . Once again we have  $w_{i,1}\leq v_{i,1}$  for i>1 and  $w_{1,1}\leq v_{1,1}+1$ . The case  $w_{1,1}+\cdots+nw_{n,1}=n-1$  occurs with  $w_{1,1}=v_{1,1}+1$ ,  $w_{i,1}=v_{i,1}$  for i>1. The case  $w_{1,1}+\cdots+nw_{n,1}=n$  never occurs. The contribution coming from (7.3) equals

$$-(-1)^{v_{1,1}+\cdots+v_{n,1}}$$

The contribution from (7.4) will be analyzed in the more general case of  $w_{1,1} = 0$ . We have

$$\sum_{\substack{0 \le 2w_{2,1} + \dots + nw_{n,1} \le n-2 \\ i=2}} \prod_{i=2}^{n} (-1)^{w_{i,1}} \binom{v_{i,n} + \dots + v_{i,1}}{w_{i,1}}.$$

Notice that

$$\sum_{\substack{0 \le 2w_{2,1} + \dots + nw_{n,1} \le n \\ i=2}} \prod_{i=2}^{n} (-1)^{w_{i,1}} \binom{v_{i,n} + \dots + v_{i,1}}{w_{i,1}} = 0,$$

unless  $v_{i,n} + \cdots + v_{i,1} = 0$  for all i > 1 and in that case the above sum equals 1. Apart from that term, we obtain that the contribution to the coefficient is given by

$$-\sum_{2w_{2,1}+\cdots+nw_{n,1}=n-1,n}\prod_{i=2}^{n}(-1)^{w_{i,1}}\binom{v_{i,n}+\cdots+v_{i,1}}{w_{i,1}}.$$

Because of the previous considerations and the fact that  $v_{1,1} + \cdots + v_{1,n}$  must be positive for  $X_{\mathbf{v}}(\mathbf{a})$  to appear in this sum, this contribution only appears if  $v_{1,1} = 1$  and  $v_{i,j} = 0$  for j > 1. The only possibility is  $w_{1,1} = 0$ ,  $w_{i,1} = v_{i,1}$  for i > 1, and we obtain

$$-(-1)^{v_{2,1}+\cdots+v_{n,1}}=(-1)^{v_{1,1}+\cdots+v_{n,1}}.$$

7.3. The term C. Finally, we look at expression C.

$$\sum_{0 \leq w_{1,1} + 2w_{1,2} + \dots + nw_{1,n} \leq n-2} \gamma(w_{1,1}, w_{1,2}, \dots, w_{1,n})$$

$$\times (-1)^{w_{1,1} + \dots + nw_{1,n}} \binom{v_{1,n}}{w_{1,n}} \binom{v_{1,n} + v_{1,n-1} - w_{1,n}}{w_{1,n-1}} \cdots \binom{v_{1,n} + \dots + v_{1,1} - w_{1,n} - \dots w_{1,2}}{w_{1,1}}$$

$$\times \sum_{0 \leq 2w_{2,1} + \dots + nw_{n,1} \leq n-2 - (w_{1,1} + 2w_{1,2} + \dots + nw_{1,n})} \prod_{i=2}^{n} (-1)^{w_{i,1}} \binom{v_{i,n} + \dots + v_{i,1}}{w_{i,1}}.$$

Because of Equations (7.1) and (7.2),

$$\sum_{0 \leq w_{1,1}+2w_{1,2}+\dots+nw_{1,n} \leq n} \gamma(w_{1,1},w_{1,2},\dots,w_{1,n})$$

$$\times (-1)^{w_{1,1}+\dots+nw_{1,n}} \binom{v_{1,n}}{w_{1,n}} \binom{v_{1,n}+v_{1,n-1}-w_{1,n}}{w_{1,n-1}} \cdots \binom{v_{1,n}+\dots+v_{1,1}-w_{1,n}-\dots w_{1,2}}{w_{1,1}}$$

$$\times \sum_{0 \leq 2w_{2,1}+\dots+nw_{n,1} \leq n-(w_{1,1}+2w_{1,2}+\dots+nw_{1,n})} \prod_{i=2}^{n} (-1)^{w_{i,1}} \binom{v_{i,n}+\dots+v_{i,1}}{w_{i,1}} = 0,$$

**unless**  $v_{i,n} + \cdots + v_{i,1} = 0$  for all i > 1. In that case, we obtain

$$\sum_{\substack{0 \leq w_{1,1} + 2w_{1,2} + \dots + nw_{1,n} \leq n-2 \\ \exists j_0, w_{1,j_0} \neq 0}} \gamma(w_{1,1}, w_{1,2}, \dots, w_{1,n})$$

$$\times (-1)^{w_{1,1} + \dots + nw_{1,n}} \binom{v_{1,n}}{w_{1,n}} \binom{v_{1,n} + v_{1,n-1} - w_{1,n}}{w_{1,n-1}} \cdots \binom{v_{1,n} + \dots + v_{1,1} - w_{1,n} - \dots + w_{1,2}}{w_{1,1}}$$

$$= f(v_{1,1}, \dots, v_{1,n}) - \sum_{\substack{0 \leq w_{1,1} + 2w_{1,2} + \dots + nw_{1,n} = 0, n-1, n}} \gamma(w_{1,1}, w_{1,2}, \dots, w_{1,n})$$

$$\times (-1)^{w_{1,1} + \dots + nw_{1,n}} \binom{v_{1,n}}{w_{1,n}} \binom{v_{1,n} + v_{1,n-1} - w_{1,n}}{w_{1,n-1}} \cdots \binom{v_{1,n} + \dots + v_{1,1} - w_{1,n} - \dots + w_{1,2}}{w_{1,1}}.$$

The case  $w_{1,1} + 2w_{1,2} + \cdots + nw_{1,n} = n-1$  together with the conditions  $w_{1,i} + \cdots + w_{1,n} \le v_{1,i} + \cdots + v_{1,n}$  for all i and  $v_{1,1} + 2v_{1,2} + \cdots + nv_{1,n} = n$  imply that there is a  $j_0 > 1$  such that  $w_{1,j_0-1} = v_{1,j_0-1} + 1$  and  $w_{1,j_0} = v_{1,j_0} - 1$ , or  $w_{1,1} = v_{1,1} - 1$ . This term yields

$$-\sum_{j=1}^{n} \gamma(v_{1,1}, \dots, v_{1,j-1} + 1, v_{1,j} - 1, \dots, v_{1,n})(-1)^{v_{1,1} + \dots + nv_{1,n} - 1} v_{1,j}$$

$$= (-1)^{v_{1,1} + \dots + nv_{1,n}} \gamma(v_{1,1}, \dots, v_{1,n})$$

by construction of  $\gamma$ , provided that there is an  $i_0 > 1$  such that  $v_{1,i_0} \neq 0$ . Otherwise, we obtain

$$(-1)^{v_{1,1}}v_{1,1}\gamma(v_{1,1}-1,0,\ldots,0) = (-1)^{v_{1,1}}\alpha_{v_{1,1}} - (-1)^{v_{1,1}} = (-1)^{v_{1,1}}(\gamma(v_{1,1},0,\ldots,0)-1).$$

The case  $w_{1,1}+2w_{1,2}+\cdots+nw_{1,n}=n$  together with the conditions  $w_{1,i}+\cdots+w_{1,n}\leq v_{1,i}+\cdots+v_{1,n}$  for all i and  $v_{1,1}+2v_{1,2}+\cdots+nv_{1,n}=n$  imply that  $w_{1,j}=v_{1,j}$  for all j and yields

$$-(-1)^{v_{1,1}+\cdots+nv_{1,n}}\gamma(v_{1,1},\ldots,v_{1,n}).$$

We remark that the case  $v_{1,j} = 0$  for j > 1 yields

$$-(-1)^{v_{1,1}}\alpha_{v_{1,1}} = -(-1)^{v_{1,1}}\gamma(v_{1,1},0,\ldots,0).$$

The term with  $w_{1,1} = \cdots = w_{1,n} = 0$  will be considered in a more general setting. If  $v_{i_0,n} + \cdots + v_{i_0,1} \neq 0$  for some  $i_0 > 1$ , the contribution is given by

(7.6) 
$$-\gamma(0,\ldots,0) \sum_{2w_{2,1}+\cdots+nw_{n,1}\leq n-2} \prod_{i=2}^{n} (-1)^{w_{i,1}} \binom{v_{i,n}+\cdots+v_{i,1}}{w_{i,1}}.$$

The case  $w_{1,1} + 2w_{1,2} + \cdots + nw_{1,n} + 2w_{2,1} + \cdots + nw_{n,1} \ge n-1$  implies

$$\sum_{i,j} ijv_{i,j} - 1 = n - 1 \le w_{1,1} + 2w_{1,2} + \dots + nw_{1,n} + 2w_{2,1} + \dots + nw_{n,1} \le \sum_{j} jv_{1,j} + \sum_{i>1,j} iv_{i,j}$$

which gives

$$\sum_{i>1, j} i(j-1)v_{i,j} \le 1.$$

This can only happen if  $v_{i,j} = 0$  for i, j > 1. Back to Equation (7.5),

$$-\sum_{w_{1,1}+2w_{1,2}+\cdots+nw_{1,n}+2w_{2,1}+\cdots+nw_{n,1}=n-1,n}\gamma(w_{1,1},w_{1,2},\ldots,w_{1,n})$$

$$\times (-1)^{w_{1,1}+\cdots+nw_{1,n}} \binom{v_{1,n}}{w_{1,n}} \binom{v_{1,n}+v_{1,n-1}-w_{1,n}}{w_{1,n-1}} \cdots \binom{v_{1,n}+\cdots+v_{1,1}-w_{1,n}-\cdots w_{1,2}}{w_{1,1}}$$

$$\times \prod_{i=2}^{n} (-1)^{w_{i,1}} \binom{v_{i,1}}{w_{i,1}}.$$

We see that  $w_{i,1} \leq v_{i,1}$  for i > 1 and  $w_{1,i} + \cdots + w_{1,n} \leq v_{1,i} + \cdots + v_{1,n}$  for any i. The condition  $w_{1,1} + 2w_{2,1} + \cdots + nw_{n,1} + 2w_{1,2} + \cdots + nw_{1,n} = n$  is only possible if  $w_{i,1} = v_{i,1}$  for i > 1 and  $w_{1,i} + \cdots + w_{1,n} = v_{1,i} + \cdots + v_{1,n}$  for all i, which implies  $w_{1,i} = v_{1,i}$ . The condition  $w_{1,1} + 2w_{2,1} + \cdots + nw_{n,1} + 2w_{1,2} + \cdots + nw_{1,n} = n - 1$  is only possible if  $w_{i,1} = v_{i,1}$  for i > 1 and  $w_{1,j_0} = v_{1,j_0} - 1$  and  $w_{1,j_0-1} = v_{1,j_0-1} + 1$  for a unique  $j_0$  fixed (this includes the case  $j_0 = 1$ , with the second condition empty) and  $w_{1,j} = v_{1,j}$  for the other j.

Therefore, the contribution to the coefficient is given by

$$(-1)^{v_{2,1}+\cdots+v_{n,1}+v_{1,1}+\cdots+nv_{1,n}} \sum_{j=1}^{n} \gamma(v_{1,1},\ldots,v_{1,j-1}+1,v_{1,j}-1,\ldots,v_{1,n}) v_{1,j}$$

$$- (-1)^{v_{2,1}+\cdots+v_{n,1}+v_{1,1}+\cdots+nv_{1,n}} \gamma(v_{1,1},v_{1,2},\ldots,v_{1,n}).$$

This term equals 0, unless  $v_{1,j} = 0$  for all j > 1. In that case, this term equals

$$-(-1)^{v_{1,1}+v_{2,1}+\cdots+v_{n,1}}$$
.

The term  $w_{1,1} = \cdots = w_{1,n} = 0$  yields Equation (7.6):

$$-\gamma(0,\ldots,0)\sum_{0<2w_{2,1}+\cdots+nw_{n,1}< n-2}\prod_{i=2}^{n}(-1)^{w_{i,1}}\binom{v_{i,n}+\cdots+v_{i,1}}{w_{i,1}}.$$

Notice that

$$-\gamma(0,\ldots,0)\sum_{0\leq 2w_{2,1}+\cdots+nw_{n,1}\leq n}\prod_{i=2}^{n}(-1)^{w_{i,1}}\binom{v_{i,n}+\cdots+v_{i,1}}{w_{i,1}}=0,$$

unless  $v_{i,n} + \cdots + v_{i,1} = 0$  for all i and in that case the above sum equals  $-\gamma(0,\ldots,0) = -1$ . In addition, we obtain a contribution given by

$$\gamma(0,\ldots,0) \sum_{2w_{2,1}+\cdots+nw_{n,1}=n-1,n} \prod_{i=2}^{n} (-1)^{w_{i,1}} \binom{v_{i,n}+\cdots+v_{i,1}}{w_{i,1}}.$$

But the sum  $2w_{2,1} + \cdots + nw_{n,1} \ge n-1$  implies that

$$\sum_{i,j} ijv_{i,j} - 1 = n - 1 \le 2w_{2,1} + \dots + nw_{n,1} \le \sum_{i>1,j} iv_{i,j}$$

which implies

$$\sum_{j} j v_{1,j} + \sum_{i>1,j} i(j-1)v_{i,j} \le 1.$$

Thus  $v_{i,j} = 0$  for j > 1 and  $v_{1,1} > 0$  (it can not be zero, since one term of the form  $v_{1,j}$  must be nonzero). In addition, since  $w_{1,1} = 0$ , we have that  $v_{1,1} = 1$ , and  $2w_{2,1} + \cdots + nw_{n,1} = n - 1$  can only happen if  $w_{i,1} = v_{i,1}$ , while the case  $2w_{2,1} + \cdots + nw_{n,1} = n$  never occurs. The contribution is

$$(-1)^{v_{2,1}+\cdots+v_{n,1}} = -(-1)^{v_{1,1}+\cdots+v_{n,1}}.$$

7.4. Putting the terms together. We compute the final coefficient for  $X_{\mathbf{v}}(\mathbf{a})$  in A+B+C by considering each case.

If  $v_{i,j} \neq 0$  for some i, j > 1, then the coefficient is 0 unless we are in the case of  $X_{(d^{n/d})}$ , in which the coefficient is d.

The remaining nonzero coefficients correspond to  $v_{i,j}=0$  for all i,j>1. Table 1 has a summary of the results in this case, taking into account that  $n\geq 2$ . Here \* indicates that any value is allowed and  $v_{i,1}>0$  (resp.  $v_{1,j}>0$ ) indicates that the inequality is true for at least one subindex i>1 (resp. j>2). Finally, f is short for  $f(v_{1,1},\ldots,v_{1,n})$ .

We see that the final coefficient for  $X_{\mathbf{v}}(\mathbf{a})$  such that  $v_{i,j} = 0$  for all i, j > 1 is given by 0 if  $v_{i_0,1} > 0$  for some  $i_0 > 1$ , and  $f(v_{1,1}, \ldots, v_{1,n})$  otherwise. Now, Proposition 6.1 gives that the left hand side of A + B + C equals

$$\sum_{d|n} dX_{(d^{n/d})}(\mathbf{a}) + \sum_{\substack{\mathbf{v} \\ v_{i,j}=0,i>1}} (-1)^n \frac{n!}{(1!)^{v_{1,1}}(2!)^{v_{1,2}} \cdots (n!)^{v_{1,n}}} X_{\mathbf{v}}(\mathbf{a}).$$

A special mention deserves  $X_{(1^n)}$  that appears in both terms giving a final coefficient of  $1 + (-1)^n$ . Finally, we note that

$$X_{(d^{n/d})}(0,a) = \begin{cases} H_d\left(0, \frac{ad}{n}\right) & p \nmid \frac{n}{d}, \\ 0 & p \mid \frac{n}{d}. \end{cases}$$

We can then write

$$\sum_{\substack{d \mid n \\ p \nmid \frac{n}{2}}} dH_d\left(0, \frac{ad}{n}\right) + \sum_{\substack{\mathbf{v} \\ v_{i,j} = 0, i > 1}} (-1)^n \frac{n!}{(1!)^{v_{1,1}} (2!)^{v_{1,2}} \cdots (n!)^{v_{1,n}}} X_{\mathbf{v}}(0, a),$$

which is the left hand side of Equation (3.1).

The right hand side of A + B + C can be computed quite easily by the following observation. If we take the equations with  $\ell = 0$  (no conditions on the coefficients), then we must necessarily arrive at Equation (3.3), which is true since it is the result of Möebius inversion on Equation (3.7) combined with Equation (3.5). The combination that we take with  $\ell = 2$  (resp.  $\ell = 1$ ) is the result of dividing the right hand side of each equation by  $q^2$  (resp. q). In this way we arrive at Equation (3.1) (resp. (3.4)).

## 8. Some particular cases

In this section we consider the cases n=4 and n=5 (for  $\ell=2$ ) to illustrate how the proof works. In order to simplify the notation we omit the **a** part from  $\mathcal{E}_{\mathbf{w}}(\mathbf{a})$ .

8.1. Case n=4. We can find that  $\gamma(1,0)=\gamma(0,1)=2$  and  $\gamma(2,0)=5$ . In this case, we have

$$A : 4\mathcal{E}_{(0)} - 3\mathcal{E}_{(1)} - 2\mathcal{E}_{(2)} + 2\mathcal{E}_{(1,1)},$$
  

$$B : \mathcal{E}_{(1)} - \mathcal{E}_{(1,1)},$$
  

$$C : -2\mathcal{E}_{(1)} + 2\mathcal{E}_{(1^2)} + 5\mathcal{E}_{(1,1)}.$$

Thus

$$(8.1) A + B + C = 4\mathcal{E}_{(0)} - 4\mathcal{E}_{(1)} + 2\mathcal{E}_{(1^2)} - 2\mathcal{E}_{(2)} + 6\mathcal{E}_{(1,1)}.$$

Table 2 contains all the equations involved, separated by left hand side (LHS) and right hand side (RHS).

(1,1)	$6X_{(1,1,1,1)} + 3X_{(1,1,1^2)} + X_{(1^2,1^2)} + X_{(1,1^3)} + X_{(1,1,2)}$	$\frac{q(q-1)}{2}$

Table 2. Equations for the case n=4.

We obtain

$$4X_{(4)} + 2X_{(2^2)} + X_{(1^4)} + 24X_{(1,1,1,1)} + 12X_{(1,1,1^2)} + 4X_{(1,1^3)} + 6X_{(1^2,1^2)} + X_{(1^4)} \quad = \quad 2q^2,$$

which is the result predicted by Theorem 1.1.

8.2. Case n = 5. We find some values of  $\gamma$ .

v	LHS $\mathcal{E}_{\mathbf{v}}$	RHS $\mathcal{E}_{\mathbf{v}}$
(0)	$X_{(1,1,1,1,1)} + X_{(1,1,1,1^2)} + X_{(1,1^2,1^2)} + X_{(1,1,1^3)} + X_{(1,1^4)} + X_{(1^5)} + X_{(1,1,1,2)} $ $+ X_{(1,1^2,2)} + X_{(1^3,2)} + X_{(1,2,2)} + X_{(1,2^2)} + X_{(1,1,3)} + X_{(1^2,3)} + X_{(1,4)} + X_{(2,3)} + X_{(5)}$	$q^3$
(1)	$5X_{(1,1,1,1,1)} + 4X_{(1,1,1,1^2)} + 3X_{(1,1^2,1^2)} + 3X_{(1,1,1^3)} + 2X_{(1,1^4)} + X_{(1^5)} + 3X_{(1,1,1,2)} $ $+2X_{(1,1^2,2)} + X_{(1^3,2)} + X_{(1,2,2)} + X_{(1,2^2)} + 2X_{(1,1,3)} + X_{(1^2,3)} + X_{(1,4)}$	$q^3$
$(1^2)$	$X_{(1,1,1,1^2)} + 2X_{(1,1^2,1^2)} + X_{(1,1,1^3)} + X_{(1,1^4)} + X_{(1^5)} + X_{(1,1^2,2)} + X_{(1^3,2)} + X_{(1^2,3)}$	$q^2$
$(1^3)$	$X_{(1,1,1^3)} + X_{(1,1^4)} + X_{(1^5)} + X_{(1^3,2)}$	q
(2)	$X_{(1,1,1,2)} + X_{(1,1^2,2)} + X_{(1^3,2)} + 2X_{(1,2,2)} + X_{(1,2^2)} + X_{(2,3)}$	$\frac{q^2(q-1)}{2}$
(3)	$X_{(1,1,3)} + X_{(1^2,3)} + X_{(2,3)}$	$\frac{q(q^2-1)}{3}$
(1,1)	$10X_{(1,1,1,1,1)} + 6X_{(1,1,1,1^2)} + 3X_{(1,1^2,1^2)} + 3X_{(1,1,1^3)} + X_{(1,1^4)} + 3X_{(1,1,1,2)} + X_{(1,1^2,2)} + X_{(1,1,3)}$	$\frac{q^2(q-1)}{2}$
(1,2)	$3X_{(1,1,1,2)} + 2X_{(1,1^2,2)} + X_{(1^3,2)} + 2X_{(1,2,2)} + X_{(1,2^2)}$	$\frac{q^2(q-1)}{2}$
$(1,1^2)$	$3X_{(1,1,1,1^2)} + 4X_{(1,1^2,1^2)} + 2X_{(1,1,1^3)} + X_{(1,1^4)} + X_{(1,1^2,2)}$	q(q-1)
(1, 1, 1)	$10X_{(1,1,1,1,1)} + 4X_{(1,1,1,1^2)} + X_{(1,1^2,1^2)} + X_{(1,1,1^3)} + X_{(1,1,1,2)}$	$\frac{q(q-1)(q-2)}{6}$

Table 3. Equations for the case n = 5.

$\gamma(1,0)$	(0, 0)	$\gamma(0, 1, 0)$	$\gamma(0, 0, 1)$	$\gamma(2, 0, 0)$	$\gamma(1, 1, 0)$	$\gamma(3, 0, 0)$
2		2	2	5	7	16

In this case, we have

$$\begin{array}{lcl} A & : & 5\mathcal{E}_{(0)} - 4\mathcal{E}_{(1)} - 3\mathcal{E}_{(2)} - 2\mathcal{E}_{(3)} + 3\mathcal{E}_{(1,1)} + 2\mathcal{E}_{(1,2)} - 2\mathcal{E}_{(1,1,1)}, \\ B & : & \mathcal{E}_{(1)} - \mathcal{E}_{(1,1)} - \mathcal{E}_{(1,2)} + \mathcal{E}_{(1,1,1)}, \\ C & : & -2\mathcal{E}_{(1)} + 2\mathcal{E}_{(1^2)} - 2\mathcal{E}_{(1^3)} + 5\mathcal{E}_{(1,1)} - 7\mathcal{E}_{(1,1^2)} + 2\mathcal{E}_{(1,2)} - 16\mathcal{E}_{(1,1,1)}. \end{array}$$

Then

$$(8.2) \hspace{3.1em} A+B+C \hspace{0.2em} = \hspace{0.2em} 5\mathcal{E}_{(0)} - 5\mathcal{E}_{(1)} + 2\mathcal{E}_{(1^2)} - 2\mathcal{E}_{(1^3)} - 3\mathcal{E}_{(2)} - 2\mathcal{E}_{(3)} + 7\mathcal{E}_{(1,1)} + 3\mathcal{E}_{(1,2)} - 7\mathcal{E}_{(1,1^2)} - 17\mathcal{E}_{(1,1,1)},$$

Table 3 contains all the equations involved in A + B + C.

Summing according to the coefficients from Equation (8.2), we get

$$5X_{(5)} + X_{(1^5)} - 120X_{(1,1,1,1,1)} - 60X_{(1,1,1,1^2)} - 30X_{(1,1^2,1^2)} - 20X_{(1,1,1^3)} - 5X_{(1,1^4)} - X_{(1^5)} = 0,$$
 which is the result predicted by Theorem 1.1.

## 9. Conclusion

We have proven the formula for the number of irreducible polynomials with first two prescribed coefficients by using combinatorial methods and results from the theory of quadratic forms over finite fields. Our method also gives a proof for the formula for the number of irreducible polynomials with the first prescribed coefficient and has the potential of leading results for other prescribed factorization types. In principle, this method could be extended to a higher number of fixed coefficients. This condition would restrict the number of equations  $\mathcal{E}_{\mathbf{w}}$  that we can use and the equivalent expression for  $\sum_{\substack{d|n\\p\nmid\frac{n}{d}}} dH_d$  will now involve terms  $X_{\mathbf{v}}(\mathbf{a})$ 

whose matrices V contain nonzero entries outside the first row. It should be interesting to explore the feasibility of this method for  $\ell > 2$ .
